## Deep Learning for Scientific Computing?

## Still not a complete story.

Outline
■ Neural Network Approximation

- Exponential Approximation Rate
- Curse of dimensonality
- Deep network is powerful

■ Neural Network Optimization

- Global convergence for supervised learning
- Global convergence for solving PDEs
- But assumption is strong
- Neural Network Generalization
- Generalization for supervised learning
- Generalization for solving PDEs
- But requires regularization

## Deep neural networks

$$
y=h(x ; \theta):=T \circ \phi(x):=T \circ h^{(L)} \circ h^{(L-1)} \circ \cdots \circ h^{(1)}(x)
$$

## where

$\square h^{(i)}(x)=\sigma\left(W^{(i)^{T}} x+b^{(i)}\right)$;
■ $T(x)=V^{T} x$;
$\square \theta=\left(W^{(1)}, \cdots, W^{(L)}, b^{(1)}, \cdots, b^{(L)}, V\right)$.

## Supervised deep learning

## Conditions

- Given data pairs $\left\{\left(x_{i}, y_{i}=f\left(x_{i}\right)\right)\right\}$ from an unknown map $f(x)$ defined on $\Omega$
- $\left\{x_{i}\right\}_{i=1}^{n}$ are sampled randomly from an unknown distribution $U(x)$ on $\Omega$

Goal
Recover the unknown map $f(x)$
Deep learning

- Design a family of DNNs $\{h(x ; \theta)\}_{\theta}$ of
 a given size
■ Find the best DNN $h(x ; \theta) \approx f(x)$ on $\Omega$

## Supervised deep learning

## Deep learning ideally

■ Quantify how good $h(x ; \theta) \approx f(x)$ via the population loss:

$$
R_{D}(\theta) \stackrel{\text { e.g. }}{=} \mathrm{E}_{x \sim U(\Omega)}\left[|h(x ; \theta)-f(x)|^{2}\right]
$$

■ The best solution is $h\left(x ; \theta_{D}\right)$ with

$$
\theta_{D}=\operatorname{argmin} R_{D}(\theta)
$$

- But $U(\Omega)$ is not known

## Deep learning in practice

■ Only the empirical loss is available:

$$
R_{S}(\theta):=\frac{1}{N} \sum_{i=1}^{N}\left(h\left(x_{i} ; \theta\right)-y_{i}\right)^{2}
$$

■ The best empirical solution is $h\left(x ; \theta_{S}\right)$ with

$$
\theta_{S}=\operatorname{argmin} R_{S}(\theta)
$$

■ Numerical optimization to obtain a numerical solution $h\left(x ; \theta_{N}\right)$.
■ In practice, $\theta_{N} \neq \theta_{S} \neq \theta_{D}$ and how good $R_{D}\left(\theta_{N}\right)$ is?

## Supervised deep learning

A full error analysis of $R_{D}\left(\theta_{N}\right)$

$$
\begin{aligned}
R_{D}\left(\theta_{N}\right)= & {\left[R_{D}\left(\theta_{N}\right)-R_{S}\left(\theta_{N}\right)\right]+\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right]+\left[R_{S}\left(\theta_{S}\right)-R_{S}\left(\theta_{D}\right)\right] } \\
& +\left[R_{S}\left(\theta_{D}\right)-R_{D}\left(\theta_{D}\right)\right]+R_{D}\left(\theta_{D}\right) \\
\leq & R_{D}\left(\theta_{D}\right)+\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right] \\
& +\left[R_{D}\left(\theta_{N}\right)-R_{S}\left(\theta_{N}\right)\right]+\left[R_{S}\left(\theta_{D}\right)-R_{D}\left(\theta_{D}\right)\right]
\end{aligned}
$$

## Supervised deep learning

A full error analysis of $R_{D}\left(\theta_{N}\right)$

$$
\begin{aligned}
R_{D}\left(\theta_{N}\right)= & {\left[R_{D}\left(\theta_{N}\right)-R_{S}\left(\theta_{N}\right)\right]+\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right]+\left[R_{S}\left(\theta_{S}\right)-R_{S}\left(\theta_{D}\right)\right] } \\
& +\left[R_{S}\left(\theta_{D}\right)-R_{D}\left(\theta_{D}\right)\right]+R_{D}\left(\theta_{D}\right) \\
\leq & R_{D}\left(\theta_{D}\right)+\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right] \\
& +\left[R_{D}\left(\theta_{N}\right)-R_{S}\left(\theta_{N}\right)\right]+\left[R_{S}\left(\theta_{D}\right)-R_{D}\left(\theta_{D}\right)\right]
\end{aligned}
$$

■ $R_{D}\left(\theta_{D}\right)=\int_{\Omega}\left(h\left(x ; \theta_{D}\right)-f(x)\right)^{2} d \mu(x) \leq \int_{\Omega}(h(x ; \tilde{\theta})-f(x))^{2} d \mu(x)$ can be bounded by a constructive approximation of $\tilde{\theta}$

## Supervised deep learning

A full error analysis of $R_{D}\left(\theta_{N}\right)$

$$
\begin{aligned}
R_{D}\left(\theta_{N}\right)= & {\left[R_{D}\left(\theta_{N}\right)-R_{S}\left(\theta_{N}\right)\right]+\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right]+\left[R_{S}\left(\theta_{S}\right)-R_{S}\left(\theta_{D}\right)\right] } \\
& +\left[R_{S}\left(\theta_{D}\right)-R_{D}\left(\theta_{D}\right)\right]+R_{D}\left(\theta_{D}\right) \\
\leq & R_{D}\left(\theta_{D}\right)+\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right] \\
& +\left[R_{D}\left(\theta_{N}\right)-R_{S}\left(\theta_{N}\right)\right]+\left[R_{S}\left(\theta_{D}\right)-R_{D}\left(\theta_{D}\right)\right]
\end{aligned}
$$

■ $R_{D}\left(\theta_{D}\right)=\int_{\Omega}\left(h\left(x ; \theta_{D}\right)-f(x)\right)^{2} d \mu(x) \leq \int_{\Omega}(h(x ; \tilde{\theta})-f(x))^{2} d \mu(x)$ can be bounded by a constructive approximation of $\tilde{\theta}$
■ $\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right]$ is the optimization error

## Supervised deep learning

A full error analysis of $R_{D}\left(\theta_{N}\right)$

$$
\begin{aligned}
R_{D}\left(\theta_{N}\right)= & {\left[R_{D}\left(\theta_{N}\right)-R_{S}\left(\theta_{N}\right)\right]+\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right]+\left[R_{S}\left(\theta_{S}\right)-R_{S}\left(\theta_{D}\right)\right] } \\
& +\left[R_{S}\left(\theta_{D}\right)-R_{D}\left(\theta_{D}\right)\right]+R_{D}\left(\theta_{D}\right) \\
\leq & R_{D}\left(\theta_{D}\right)+\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right] \\
& +\left[R_{D}\left(\theta_{N}\right)-R_{S}\left(\theta_{N}\right)\right]+\left[R_{S}\left(\theta_{D}\right)-R_{D}\left(\theta_{D}\right)\right]
\end{aligned}
$$

■ $R_{D}\left(\theta_{D}\right)=\int_{\Omega}\left(h\left(x ; \theta_{D}\right)-f(x)\right)^{2} d \mu(x) \leq \int_{\Omega}(h(x ; \tilde{\theta})-f(x))^{2} d \mu(x)$ can be bounded by a constructive approximation of $\tilde{\theta}$
■ $\left[R_{S}\left(\theta_{N}\right)-R_{S}\left(\theta_{S}\right)\right]$ is the optimization error

- Other two terms are the generalization error

## Deep Learning for Solving PDEs

## Goals

Learning the solutions of high-dimensional and highly nonlinear PDEs
Challenges for traditional methods

- curse of dimensionality

Machine learning for PDEs
■ Owens and Filkin, 1989; Lee and Kang, 1990; Dissanayake and Phan-Thien, 1994

- RBM, Quantum Many-Body Problem, Giuseppe Carleo, Matthias Troyer, 2016
■ BSDE, Han et al, 2017
■ DGM, Sirignano and Spiliopoulos, 2017
■ Deep Ritz, E and Yu, 2017
■ PINN, Raissi, Perdikaris, and Karniadakis, 2017

## Least Square Methods

Neural networks + least square for PDEs (date back to 1990s),

$$
\begin{aligned}
& \mathcal{D}(u)=f \quad \text { in } \Omega, \\
& \mathcal{B}(u)=g \quad \text { on } \partial \Omega .
\end{aligned}
$$

A DNN $\phi\left(\boldsymbol{x} ; \boldsymbol{\theta}^{*}\right)$ is constructed to approximate the solution $u(\boldsymbol{x})$ via

$$
\begin{aligned}
\boldsymbol{\theta}^{*} & =\underset{\boldsymbol{\theta}}{\operatorname{argmin}} \mathcal{L}(\boldsymbol{\theta}) \\
& :=\underset{\boldsymbol{\theta}}{\operatorname{argmin}}\|\mathcal{D} \phi(\boldsymbol{x} ; \boldsymbol{\theta})-f(\boldsymbol{x})\|_{2}^{2}+\lambda\|\mathcal{B} \phi(\boldsymbol{x} ; \boldsymbol{\theta})-g(\boldsymbol{x})\|_{2}^{2}
\end{aligned}
$$

## Least Square Methods

We aim at the full error analysis:

- Approximation theory
- Optimization theory

■ Generalization theory

## Deep Network Approximation

## Goals

■ The curse of dimensionality exist? e.g., \# parameters not $\left(\frac{1}{\epsilon}\right)^{d}$
■ Is exponential approximation rate available? e.g., \# parameters $\log \left(\frac{1}{\epsilon}\right)$

Why this goal?
■ Computational efficiency especially in high dimension

## Literature Review

Active research directions
Cybenko, 1989; Hornik et al., 1989; Barron, 1993; Liang and Srikant, 2016; Yarotsky, 2017; Poggio et al., 2017; Schmidt-Hieber, 2017; E and Wang, 2018; Petersen and Voigtlaender, 2018; Chui et al., 2018; Yarotsky, 2018; Nakada and Imaizumi, 2019; Gribonval et al., 2019; Gühring et al., 2019; Chen et al., 2019; Li et al., 2019; Suzuki, 2019; Bao et al., 2019; E et al., 2019; Opschoor et al., 2019; Yarotsky and Zhevnerchuk, 2019; Bölcskei et al., 2019; Montanelli and Du, 2019; Chen and Wu, 2019; Zhou, 2020; Montanelli et al., 2020, etc.

## Literature Review

Functions spaces

- Continuous functions
- Smooth functions
- Functions with integral representations

ReLU DNNs, continuous functions $C\left([0,1]^{d}\right)$

ReLU; Fixed network width $O(N)$ and depth $O(L)$
■ Nearly tight error rate $5 \omega_{f}\left(8 \sqrt{d} N^{-2 / d} L^{-2 / d}\right)$ simultaneously in $N$ and $L$ with $L^{\infty}$-norm. Shen, Y., and Zhang (CiCP, 2020)

- $\omega_{f}$ is the modulas of continuity
- Improved to a tight rate $O\left(\sqrt{d} \omega_{f}\left(\left(N^{2} L^{2} \log _{3}(N+2)\right)^{-1 / d}\right)\right)$. Shen, Y., and Zhang (J Math Pures Appl, 2021)

Curse of dimensionality exists!

ReLU DNNs, smooth functions $C^{s}\left([0,1]^{d}\right)$

Does smoothness help?
ReLU; Fixed network width $O(N)$ and depth $O(L)$
$■$ Nearly tight rate $85(s+1)^{d} 8^{s}\|f\|_{C^{s}\left([0,1]^{d}\right)} N^{-2 s / d} L^{-2 s / d}$ simultaneously in $N$ and $L$ with $L^{\infty}$-norm
■ Lu, Shen, Y., and Zhang (SIMA 2021)
The curse of dimensionality exists if $s$ is fixed.

## DNNs with advanced activation function

Sine-ReLU; Fixed width $O(d)$, varying depth $L$
■ $\exp \left(-c_{r, d} \sqrt{L}\right)$ with $L^{\infty}-$ norm for $C^{r}\left([0,1]^{d}\right)$

- Root exponential approximation rate achieved

■ Curse of dimensionality is not clear
■ arotsky and Zhevnerchuk, NeurIPS 2020

Floor and ReLU activation, width $O(N)$ and depth $O(d L), C\left([0,1]^{d}\right)$
■ Error rate $\omega_{f}\left(\sqrt{d} N^{-\sqrt{L}}\right)+2 \omega_{f}(\sqrt{d}) N^{-\sqrt{L}}$ with $L^{\infty}$-norm
■ Merely based on the compositional structure of DNNs
■ NO curse of dimensionality for many continuous functions

- Root exponential approximation rate

■ Shen, Y., and Zhang (Neural Computation, 2020)

## DNNs with advanced activation function

What if we use more activation functions?
Floor, Sign, and $2^{x}$ activation, width $O(N)$ and depth $3, C\left([0,1]^{d}\right)$
■ Error rate $\omega_{f}\left(\sqrt{d} 2^{-N}\right)+2 \omega_{f}(\sqrt{d}) 2^{-N}$ with $L^{\infty}$-norm
■ Merely based on the compositional structure of DNNs
■ NO curse of dimensionality for many continuous functions
■ Exponential approximation rate
■ Shen, Y., and Zhang (Neural Networks, 2021)

## Further interpretation of our result

Explicit error bound
Floor, Sign, and $2^{x}$ activation, width $O(N)$ and depth 3 , Hölder([0, 1] $\left.{ }^{d}, \alpha, \lambda\right)$

■ Error rate $3 \lambda(2 \sqrt{d})^{\alpha} 2^{-\alpha N}$ with $L^{\infty}$-norm

- NO curse of dimensionality
- Exponential approximation rate

■ Shen, Y., and Zhang (Neural Networks, 2021)

## Further interpretation of our result

## Realistic consideration

■ Constructive approximation requires $f$ or exponentially many samples given
■ Constructed parameters require high precision computation

- Floor and Sign are discontinuous functions leading to gradient vanishing
■ The network size has to be increased when $\epsilon \rightarrow 0$

## DNNs with advanced activation function

Elementary universal activation function (EUAF)
A continuous activation function without gradient vanishing

$$
\begin{gathered}
\sigma_{1}(x)=\left|x-2\left\lfloor\frac{x+1}{2}\right\rfloor\right|, \\
\sigma_{2}(x):=\frac{x}{|x|+1}, \\
\sigma(x):= \begin{cases}\sigma_{1}(x) & \text { for } x \in[0, \infty), \\
\sigma_{2}(x) & \text { for } x \in(-\infty, 0)\end{cases}
\end{gathered}
$$

Figure: An illustration of $\sigma$ on $[-10,10]$.

## DNNs with advanced activation function

Theorem (EUAF approximation in $d$-dimensions)
Arbitrarily small error with a fixed number of neurons for $C\left([0,1]^{d}\right)$.
■ For any $\epsilon>0$, there exists $\phi$ of width $36 d(2 d+1)$ and depth 11 s.t.

$$
\|f(x)-\phi(x)\|_{L^{\infty}\left([0,1]^{d}\right)} \leq \epsilon
$$

■ Shen, Y., and Zhang (arXiv:2107.02397)

## DNNs with advanced activation function

## Theorem (EUAF representation in $d$-dimensions)

Exact representation with a fixed number of neurons for classification functions.

- For any classification function $f(x)$ with $K$ classes, there exists $\phi$ of width $36 d(2 d+1)$ and depth 12 s.t.

$$
f(x)=\phi(x)
$$

on the supports of each class.
■ Shen, Y., and Zhang (arXiv:2107.02397)

DNNs with advanced activation function

Two main ideas
■ Theorem (Kolmogorov-Arnold Superposition Theorem) $\forall f(\mathbf{x}) \in C\left([0,1]^{d}\right)$, there exist $\psi_{p}(x)$ and $\phi(x)$ in $C(\mathbb{R})$ and $b_{p q} \in \mathbb{R}$ s.t.

$$
f(\mathbf{x})=\sum_{q=1}^{2 d+1} a_{q} \phi\left(\sum_{p=1}^{d} b_{p q} \psi_{p}\left(x_{p}\right)\right)
$$

■ Lemma (EUAF approximation in 1D (Shen, Y., and Zhang (arXiv:2107.02397))
NNs with width 36 and depth 5 constructed with EUAF is dense in $C([0,1])$.

## DNNs with advanced activation function

Other EUAF

- $C^{s}$ EUAF
- Sigmod EUAF

## Summary

- Deep Neural Networks are powerful

■ Quantitative approximation results are available

- How to quantify deep learning optimization and generalization errors?

## Optimization and Generalization of Deep Learning

In the setting of supervised learning:
Mean-field analysis
■ Chizat and Bach 2018; Mei et al. 2018; Mei et al. 2019, Lu et al. 2020, etc.

- Idea:

1) a two-layer neural network can be seen as an approximation to an infinitely wide neural network with parameters following a distribution $p_{t}$;
2) understanding network training via the evolution of $p_{t}$.

In the setting of solving PDEs: vastly open

## Optimization and Generalization of Deep Learning

In the setting of supervised learning:
Neural tangent kernel/Lazy training

- Idea: in the limit of infinite width, deep learning becomes kernel methods
■ Global optimization convergence:
- Jacot et al. 2018 (two layers);
- Du et al. 2019 (L layers, DNN);
- Z Allen-Zhu, Y Li, Z Song 2018 (L layers, DNN, RNN);
- D Zou*, Y Cao*, D. Zhou, and Q Gu 2018 (L layers, DNN, milder conditions)
- Chizat et al. 2018
- Generalization theory
- Y Cao and Q Gu, 2019a (GD)
- Y Cao and Q Gu, 2019b (SGD)
- Consistent optimization and generalization for classification
- Z Ji and M Telgarsky 2020
- Z Chen*, Y Cao*, D Zou, and Q Gu 2020 (SOTA)

In the setting of solving PDEs: vastly open

## Neural Tangent Kernel of Deep Learning Optimization

■ Optimization objective function:

$$
R_{S}(\boldsymbol{\theta}):=\frac{1}{N} \sum_{i=1}^{N}\left(h\left(\boldsymbol{x}_{i} ; \boldsymbol{\theta}\right)-f\left(\boldsymbol{x}_{i}\right)\right)^{2}
$$

■ Introduce $\mathcal{X}:=\left[\boldsymbol{x}_{1}, \ldots, \boldsymbol{x}_{N}\right]^{T} \in \mathbb{R}^{N \times d}$, then

- $h(\mathcal{X} ; \boldsymbol{\theta}(t)):=\left[h\left(\boldsymbol{x}_{i} ; \boldsymbol{\theta}(t)\right)\right] \in \mathbb{R}^{N}$
- $\nabla_{\boldsymbol{\theta}} h(\mathcal{X} ; \boldsymbol{\theta}(t)):=\left[\nabla_{\boldsymbol{\theta}_{j}} h\left(\boldsymbol{x}_{i} ; \boldsymbol{\theta}(t)\right)\right] \in \mathbb{R}^{N \times W}$
- $\nabla_{h(\mathcal{X} ; \boldsymbol{\theta}(t))} R_{S}:=\frac{2}{N}(h(\mathcal{X} ; \boldsymbol{\theta}(t))-f(\mathcal{X})):=\left[\frac{2}{N}\left(h\left(\boldsymbol{x}_{i} ; \boldsymbol{\theta}(t)\right)-f\left(\boldsymbol{x}_{i}\right)\right] \in \mathbb{R}^{N}\right.$

■ Gradient descent

$$
\begin{aligned}
\boldsymbol{\theta}(t+1) & =\boldsymbol{\theta}(t)-\tau \frac{2}{N} \sum_{i=1}^{N}\left(h\left(\boldsymbol{x}_{i} ; \boldsymbol{\theta}(t)\right)-f\left(\boldsymbol{x}_{i}\right)\right) \nabla_{\boldsymbol{\theta}(t)} h\left(\boldsymbol{x}_{i} ; \boldsymbol{\theta}\right) \\
& =\boldsymbol{\theta}(t)-\tau \nabla_{\boldsymbol{\theta}} h(\mathcal{X} ; \boldsymbol{\theta}(t))^{T} \nabla_{h(\mathcal{X} ; \boldsymbol{\theta}(t))} R_{S},
\end{aligned}
$$

■ Gradient flow

$$
\partial_{t} \boldsymbol{\theta}(t)=-\nabla_{\boldsymbol{\theta}} h(\mathcal{X} ; \boldsymbol{\theta}(t))^{T} \nabla_{h(\mathcal{X} ; \boldsymbol{\theta}(t))} R_{S},
$$

## Neural Tangent Kernel of Deep Learning Optimization

■ Gradient flow

$$
\partial_{t} \boldsymbol{\theta}(t)=-\nabla_{\boldsymbol{\theta}} h(\mathcal{X} ; \boldsymbol{\theta}(t))^{T} \nabla_{h(\mathcal{X} ; \boldsymbol{\theta}(t))} R_{S},
$$

■ DNN evolution

$$
\partial_{t} h(\mathcal{X} ; \boldsymbol{\theta}(t))=\nabla_{\boldsymbol{\theta}} h(\mathcal{X} ; \boldsymbol{\theta}(t)) \partial_{t} \boldsymbol{\theta}(t)=-\hat{\Theta}_{t}(\mathcal{X}, \mathcal{X}) \nabla_{h(\mathcal{X} ; \boldsymbol{\theta}(t))} R_{S}
$$

with the neural tangent kernel (NTK)

$$
\hat{\Theta}_{t}=\nabla_{\boldsymbol{\theta}} h(\mathcal{X} ; \boldsymbol{\theta}(t)) \nabla_{\boldsymbol{\theta}} h(\mathcal{X} ; \boldsymbol{\theta}(t))^{T} .
$$

■ Nonlinear ODEs and challenging to analyze

## Neural Tangent Kernel of Deep Learning Optimization

■ Linearization $h^{\operatorname{lin}}(\boldsymbol{x} ; \boldsymbol{\theta}(t)):=h(\boldsymbol{x} ; \boldsymbol{\theta}(0))+\nabla_{\boldsymbol{\theta}} h(\boldsymbol{x} ; \boldsymbol{\theta}(0))(\boldsymbol{\theta}(t)-\boldsymbol{\theta}(0)) \approx h(\boldsymbol{x} ; \boldsymbol{\theta}(t))$,
■ Approximate DNN evolution

$$
\begin{aligned}
\partial_{t} h^{\operatorname{lin}(\boldsymbol{x} ; \boldsymbol{\theta}(t))} & =-\hat{\Theta}_{0}(\boldsymbol{x}, \mathcal{X}) \nabla_{h^{\operatorname{lin}}(\boldsymbol{x} ; \boldsymbol{\theta}(t))} R_{S} \\
& =-\hat{\Theta}_{0}(\boldsymbol{x}, \mathcal{X}) \frac{2}{N}\left(h^{\operatorname{lin}}(\boldsymbol{x} ; \boldsymbol{\theta}(t))-f(\mathcal{X})\right)
\end{aligned}
$$

■ Linear ODE with a solution
$h^{\operatorname{lin}}(\boldsymbol{x} ; \boldsymbol{\theta}(t))=h(\boldsymbol{x} ; \boldsymbol{\theta}(0))-\hat{\Theta}_{0}(\boldsymbol{x}, \mathcal{X}) \hat{\Theta}_{0}^{-1}\left(I-e^{-\hat{\Theta}_{0} t}\right)(h(\mathcal{X} ; \boldsymbol{\theta}(0))-\mathcal{Y})$
and

$$
h^{\operatorname{lin}}(\mathcal{X} ; \boldsymbol{\theta}(t))=\left(I-e^{-\hat{\theta}_{0} t}\right) \mathcal{Y}+e^{-\hat{\theta}_{0} t} h(\mathcal{X} ; \boldsymbol{\theta}(0))
$$

with $\mathcal{Y}:=\left[y_{1}, \ldots, y_{N}\right]^{T} \in \mathbb{R}^{N}$.

## Neural Tangent Kernel of Deep Learning Optimization

## Approximate DNN evolution

$$
h^{\text {lin }}(\boldsymbol{x} ; \boldsymbol{\theta}(t))=h(\boldsymbol{x} ; \boldsymbol{\theta}(0))-\hat{\Theta}_{0}(\boldsymbol{x}, \mathcal{X}) \hat{\Theta}_{0}^{-1}\left(I-e^{-\hat{\Theta}_{0} t}\right)(h(\mathcal{X} ; \boldsymbol{\theta}(0))-\mathcal{Y})
$$

and

$$
h^{\operatorname{lin}}(\mathcal{X} ; \boldsymbol{\theta}(t))=\left(I-e^{-\hat{\Theta}_{0} t}\right) \mathcal{Y}+e^{-\hat{\Theta}_{0} t} h(\mathcal{X} ; \boldsymbol{\theta}(0))
$$

Insight for numerical performance
■ Spectral bias of deep learning (Rahaman et al, 2018; Xu et al, 2018, Cao et al, 2019)
■ sin activation to lessen spectral bias (Tancik et al, 2020; Sitzmann et al, 2020)
■ Wendland activation for non-singular NTK (Benson, Damle, and Townsend, 2020)
■ Reproducing activation function to reduce the condition number of NTK (Liang, Lyu, Wang, Y., 2021)

## Optimization for PDE Solvers

Question: can we apply existing optimization analysis for PDE solvers?

A simple example
$\square$ Two-layer network: $\phi(\boldsymbol{x} ; \boldsymbol{\theta})=\sum_{k=1}^{N} a_{k} \sigma\left(\boldsymbol{w}_{k}^{T} \boldsymbol{x}\right)$.
■ A second order differential equation: $\mathcal{L} u=f$ with

$$
\mathcal{L} u=\sum_{\alpha, \beta=1}^{d} \boldsymbol{A}_{\alpha \beta}(\boldsymbol{x}) u_{x_{\alpha} x_{\beta}} .
$$

■ $f(\boldsymbol{x} ; \boldsymbol{\theta}):=\mathcal{L} \phi(\boldsymbol{x} ; \boldsymbol{\theta})=\sum_{k=1}^{N} a_{k} \boldsymbol{w}_{k}^{\top} A(\boldsymbol{x}) \boldsymbol{w}_{k} \sigma^{\prime \prime}\left(\boldsymbol{w}_{k}^{T} \boldsymbol{x}\right)$ to fit $f(\boldsymbol{x})$
■ Much more difficult nonlinearity in $\boldsymbol{x}$ and $\boldsymbol{w}$ in the fitting than the original NN fitting.

## Optimization for PDE Solvers

## Assumption

■ Two-layer network: $\phi(\boldsymbol{x} ; \boldsymbol{\theta})=\sum_{k=1}^{N} a_{k} \sigma\left(\boldsymbol{w}_{k}^{T} \boldsymbol{x}\right)$ on $[0,1]^{d}$.
■ A second order differential equation: $\mathcal{L} u=f$ with

$$
\mathcal{L} u=\sum_{\alpha, \beta=1}^{d} A_{\alpha \beta}(\boldsymbol{x}) u_{x_{\alpha} \chi_{\beta}}+\sum_{\alpha=1}^{d} b_{\alpha}(\boldsymbol{x}) u_{x_{\alpha}}+c(\boldsymbol{x}) u .
$$

■ $\mathcal{L}$ satisfies the condition: there exists $M \geq 1$ such that for all $\boldsymbol{x} \in \Omega=[0,1]^{d}, \alpha, \beta \in[d]$, we have $A_{\alpha \beta}=A_{\beta \alpha}$

$$
\left|A_{\alpha \beta}(\boldsymbol{x})\right| \leq M, \quad\left|b_{\alpha}(\boldsymbol{x})\right| \leq M, \quad \text { and } \quad|c(\boldsymbol{x})| \leq M .
$$

■ Fixed $n$ samples in the PDE domain.
■ Empirical loss

$$
R_{S}(\boldsymbol{\theta})=\frac{1}{2 n} \sum_{\left\{\boldsymbol{x}_{i}\right\}_{i=1}^{n}}\left|\mathcal{L} \phi\left(\boldsymbol{x}_{i} ; \boldsymbol{\theta}\right)-f\left(\boldsymbol{x}_{i}\right)\right|^{2}
$$

and population loss

$$
R_{\mathcal{D}}(\boldsymbol{\theta})=\frac{1}{2} \mathbb{E}_{\boldsymbol{x} \sim \mathcal{D}}\left[\left|\mathcal{L} \phi\left(\boldsymbol{x}_{i} ; \boldsymbol{\theta}\right)-f\left(\boldsymbol{x}_{i}\right)\right|^{2}\right]
$$

with $\phi$ satisfying boundary conditions.

## Optimization for PDE Solvers

Luo and Y., preprint, 2020
Theorem (Linear convergence rate)
Let $\boldsymbol{\theta}^{0}:=\operatorname{vec}\left\{a_{k}^{0}, \boldsymbol{w}_{k}^{0}\right\}_{k=1}^{N}$ be the $G D$ initialization, where $a_{k}^{0} \sim \mathcal{N}\left(0, \gamma^{2}\right)$ and $\boldsymbol{w}_{k}^{0} \sim \mathcal{N}\left(\mathbf{0}, \mathbb{I}_{d}\right)$ with any $\gamma \in(0,1)$. Let $C_{d}:=\mathbb{E}\|\boldsymbol{w}\|_{1}^{12}<+\infty$ with $\boldsymbol{w} \sim \mathcal{N}\left(\mathbf{0}, \mathbb{I}_{d}\right)$ and $\lambda_{S}$ be a positive constant. For any $\delta \in(0,1)$, if width

$$
\begin{gathered}
N \geq \max \left\{\frac{512 n^{4} M^{4} C_{d}}{\lambda_{S}^{2} \delta}, \frac{200 \sqrt{2} M d^{3} n \log (4 N(d+1) / \delta) \sqrt{R_{S}\left(\theta^{0}\right)}}{\lambda_{S}},\right. \\
\\
\left.\frac{2^{23} M^{3} d^{9} n^{2}(\log (4 N(d+1) / \delta))^{4} \sqrt{R_{S}\left(\boldsymbol{\theta}^{0}\right)}}{\lambda_{S}^{2}}\right\},
\end{gathered}
$$

then with probability at least $1-\delta$ over the random initialization $\boldsymbol{\theta}^{0}$, we have, for all $t \geq 0$,

$$
R_{S}(\theta(t)) \leq \exp \left(-\frac{N \lambda_{S} t}{n}\right) R_{S}\left(\theta^{0}\right)
$$

## Generalization of PDE solvers

Luo and Y., preprint, 2020
Theorem (A posteriori generalization bound)
For any $\delta \in(0,1)$, with probability at least $1-\delta$ over the choice of random sample locations $S:=\left\{\boldsymbol{x}_{i}\right\}_{i=1}^{n}$, for any two-layer neural network $\phi(\boldsymbol{x} ; \boldsymbol{\theta})$, we have

$$
\begin{aligned}
\left|R_{\mathcal{D}}(\theta)-R_{S}(\theta)\right| \leq & \frac{\left(\|\theta\|_{\mathcal{P}}+1\right)^{2}}{\sqrt{n}} 2 M^{2}\left(14 d^{2} \sqrt{2 \log (2 d)}\right. \\
& \left.+\log \left[\pi\left(\|\theta\|_{\mathcal{P}}+1\right)\right]+\sqrt{2 \log (1 / 3 \delta)}\right)
\end{aligned}
$$

Proof: $\left|R_{\mathcal{D}}(\theta)-R_{S}(\theta)\right| \leq$ Rademacher complexity + Stat error
$\leq O\left(\frac{\|\theta\|_{P}}{\sqrt{n}}\right)+O\left(\frac{1}{\sqrt{n}}\right)$

## Generalization of PDE solvers

Regression: E, Ma, and Wu, CMS, 2019
PDE solvers: Luo and Y., preprint, 2020
Theorem (A priori generalization bound)
Suppose that $f(\boldsymbol{x})$ is in the Barron-type space $\mathcal{B}\left([0,1]^{d}\right)$ and $\lambda \geq 4 M^{2}\left[2+14 d^{2} \sqrt{2 \log (2 d)}+\sqrt{2 \log (2 / 3 \delta)}\right]$. Let

$$
\boldsymbol{\theta}_{S, \lambda}=\arg \min _{\boldsymbol{\theta}} J_{S, \lambda}(\boldsymbol{\theta}):=R_{S}(\boldsymbol{\theta})+\frac{\lambda}{\sqrt{n}}\|\boldsymbol{\theta}\|_{\mathcal{P}}^{2} \log \left[\pi\left(\|\boldsymbol{\theta}\|_{\mathcal{P}}+1\right)\right] .
$$

Then for any $\delta \in(0,1)$, with probability at least $1-\delta$ over the choice of random samples $S:=\left\{\boldsymbol{x}_{i}\right\}_{i=1}^{n}$, we have

$$
\begin{aligned}
R_{\mathcal{D}}\left(\boldsymbol{\theta}_{S, \lambda}\right) & :=\mathbb{E}_{\boldsymbol{x} \sim \mathcal{D}} \frac{1}{2}\left(\mathcal{L} \phi\left(\boldsymbol{x} ; \boldsymbol{\theta}_{S, \lambda}\right)-f(\boldsymbol{x})\right)^{2} \\
& \leq \frac{6 M^{2}\|f\|_{\mathcal{B}}^{2}}{N}+\frac{\|f\|_{\mathcal{B}}^{2}+1}{\sqrt{n}}\left(4 \lambda+16 M^{2}\right)\left\{\log \left[\pi\left(2\|f\|_{\mathcal{B}}+1\right)\right]\right. \\
& \left.+14 d^{2} \sqrt{\log (2 d)}+\sqrt{\log (2 / 3 \delta)}\right\} .
\end{aligned}
$$

Proof: $\boldsymbol{R}_{\mathcal{D}}\left(\boldsymbol{\theta}_{S, \lambda}\right) \leq$ Approximation error + Rademacher complexity + Stat error $\leq O\left(\frac{\|f\|_{\mathcal{S}}^{2}}{N}\right)+O\left(\frac{\|\theta\|_{P}}{\sqrt{n}}\right)+O\left(\frac{1}{\sqrt{n}}\right) \leq O\left(\frac{\|f\|_{\mathcal{S}}^{2}}{N}\right)+O\left(\frac{\|f\|_{\mathcal{B}}^{2}}{\sqrt{n}}\right)$

## Key ideas of our approximation

For $\boldsymbol{x} \in Q_{\boldsymbol{\beta}}$ :
$\boldsymbol{x} \rightarrow \phi_{1}(\boldsymbol{x})=\boldsymbol{\beta} \rightarrow \phi_{2}(\boldsymbol{\beta})=k_{\boldsymbol{\beta}} \rightarrow \phi_{3}\left(k_{\boldsymbol{\beta}}\right)=f\left(\boldsymbol{x}_{\boldsymbol{\beta}}\right) \approx f(\boldsymbol{x})$
■ Piecewise constant approximation:
$f(\boldsymbol{x}) \approx f_{p}(\boldsymbol{x}) \approx \phi_{3} \circ \phi_{2} \circ \phi_{1}(\boldsymbol{x})$

- $2^{N}$ pieces per dim and $2^{N d}$ pieces with accuracy $2^{-N}$
$\square$ Floor NN $\phi_{1}(\boldsymbol{x})$ s.t. $\phi_{1}(\boldsymbol{x})=\boldsymbol{\beta}$ for $\boldsymbol{x} \in Q_{\boldsymbol{\beta}}$ and $\beta \in \mathbb{Z}^{d}$.
- Linear NN $\phi_{2}$ mapping $\boldsymbol{\beta}$ to an integer $k_{\beta} \in\left\{1, \ldots, 2^{N d}\right\}$
$\square$ Key difficulty: NN $\phi_{3}$ of width $O(N)$ and depth $O(1)$ fitting $2^{N d}$ samples in 1D with accuracy $O\left(2^{-N}\right)$
- ReLU NN fails

Figure: ReLU function.

## Key ideas of our approximation

Binary representation and approximation
$\theta=\sum_{\ell=1}^{\infty} \theta_{\ell} 2^{-\ell}$ with $\theta_{\ell} \in\{0,1\}$ is approximated by $\sum_{\ell=1}^{N} \theta_{\ell} 2^{-\ell}$ with an error $2^{-N}$.

Bit extraction via a floor NN of width 2 and depth 1

$$
\phi_{k}(\theta):=\left\lfloor 2^{k} \theta\right\rfloor-2\left\lfloor 2^{k-1} \theta\right\rfloor=\theta_{k}
$$

Bit extraction via a floor NN of width 2 N and depth 1
Given $\theta=\sum_{\ell=1}^{\infty} \theta_{\ell} 2^{-\ell}$

$$
\phi(\theta):=\left(\begin{array}{c}
\phi_{1}(\theta) \\
\vdots \\
\phi_{N}(\theta)
\end{array}\right)=\left(\begin{array}{c}
\theta_{1} \\
\vdots \\
\theta_{N}
\end{array}\right) \in \mathbb{Z}^{N}
$$

## Key ideas of our approximation

Encoding $K$ numbers to one number

- Extract bits $\left\{\theta_{1}^{(k)}, \ldots, \theta_{N}^{(k)}\right\}$ from $\theta^{(k)}=\sum_{\ell=1}^{\infty} \theta_{\ell}^{(k)} 2^{-\ell}$ for

$$
k=1, \ldots, k
$$

- sum up to get

$$
a=\sum_{\ell=1}^{N} \theta_{\ell}^{(1)} 2^{-\ell}+\sum_{\ell=N+1}^{2 N} \theta_{\ell}^{(2)} 2^{-\ell}+\cdots+\sum_{\ell=(K-1) N+1}^{K N} \theta_{\ell}^{(K)} 2^{-\ell}
$$

## Decoding one number to get the $k$-th numbers

■ Extract bits $\left\{\theta_{1}^{(k)}, \ldots, \theta_{N}^{(k)}\right\}$ from a via

$$
\psi(k):=\phi\left(2^{(k-1) N} a-\left\lfloor 2^{(k-1) N} a\right\rfloor\right)
$$

of width $O(N)$ and depth $O(1)$.
■ sum up to get $\theta^{(k)} \approx \sum_{\ell=1}^{N} \theta_{\ell}^{(k)} 2^{-\ell}=\left[2^{-1}, \ldots, 2^{-N}\right] \psi(k):=\gamma(k)$,

- $\gamma(k)$ is an NN of width $O(N)$ and depth $O(1)$.

Key Lemma
There exists an NN $\gamma$ of width $O(N)$ and depth $O(1)$ that can memorize arbitrary samples $\left\{\left(k, \theta^{(k)}\right\}_{k=1}^{K}\right.$ with a precision $2^{-N}$.

## Key ideas of our approximation

For $\boldsymbol{x} \in Q_{\boldsymbol{\beta}}$ :
$\boldsymbol{x} \rightarrow \phi_{1}(\boldsymbol{x})=\boldsymbol{\beta} \rightarrow \phi_{2}(\boldsymbol{\beta})=k_{\boldsymbol{\beta}} \rightarrow \phi_{3}\left(k_{\boldsymbol{\beta}}\right)=f\left(\boldsymbol{x}_{\boldsymbol{\beta}}\right) \approx f(\boldsymbol{x})$

- Piecewise constant approximation:

$$
f(\boldsymbol{x}) \approx f_{p}(\boldsymbol{x}) \approx \phi_{3} \circ \phi_{2} \circ \phi_{1}(\boldsymbol{x})
$$

$\square 2^{N}$ pieces per dim and $2^{N d}$ pieces with accuracy $2^{-N}$
$\square$ Floor NN $\phi_{1}(\boldsymbol{x})$ s.t. $\phi_{1}(\boldsymbol{x})=\boldsymbol{\beta}$ for $\boldsymbol{x} \in Q_{\boldsymbol{\beta}}$ and $\beta \in \mathbb{Z}^{d}$.

- Linear NN $\phi_{2}$ mapping $\boldsymbol{\beta}$ to an integer $k_{\boldsymbol{\beta}} \in\left\{1, \ldots, 2^{\text {Nd }}\right\}$
$\square$ Key difficulty: NN $\phi_{3}$ of width $O(N)$ and depth $O(1)$ fitting $2^{N d}$ samples in 1D with accuracy $O\left(2^{-N}\right)$
- Key Lemma: There exists an NN $\gamma$ of width $O(N)$ and depth $O(1)$ that can memorize arbitrary samples $\left\{\left(k, \theta^{(k)}\right\}_{k=1}^{K}\right.$ with a precision $2^{-N}$.

## DNNs with advanced activation function

EUAF is more powerful than bit extraction.
Lemma (Curve filling in K-dimensions (Shen, Y., and Zhang (arXiv:2107.02397))
For any $K \in \mathbb{N}^{+}$, the following point set

$$
\left\{\left[\sigma_{1}\left(\frac{w}{\pi+1}\right), \sigma_{1}\left(\frac{w}{\pi+2}\right), \cdots, \sigma_{1}\left(\frac{w}{\pi+K}\right)\right]^{T}: w \in \mathbb{R}\right\} \subseteq[0,1]^{K}
$$

is dense in $[0,1]^{K}$, where $\pi$ is the ratio of the circumference of a circle to its diameter.

Proof. Ideas:

- Transcendental number + distinct rational numbers $\rightarrow$ rationally independent numbers
- Rationally independent numbers + periodic functions $\rightarrow$ dense set in $[0,1]^{K}$

For arbitrary $K$, NN with width 1 and depth 2 constructed with EAUF can fit $K$ points up to arbitrary accuracy.
